Haftungsausschluss und Urheberrecht

Das vorliegende Schallimmissionsgutachten für die geplanten Windenergieanlagen (WEA) am Standort Krinitz-Steeseow wurde von der SAB WindTeam GmbH im November 2022 bei der I17-Wind GmbH & Co. KG in Auftrag gegeben. Das Schallgutachten wurde nach bestem Wissen und Gewissen unparteiisch und nach dem gegenwärtigen Stand von Wissenschaft und Technik erstellt. Für die Daten die nicht von der I17-Wind GmbH & Co. KG ermittelt, erhoben und verarbeitet wurden, kann keine Garantie übernommen werden. Eine auszugsweise Vervielfältigung dieses Berichtes ist nur mit ausdrücklicher Zustimmung der I17-Wind GmbH & Co. KG erlaubt.

Urheber des vorliegenden Schallimmissionsgutachtens ist die I17-Wind GmbH & Co. KG. Der Auftraggeber erhält nach § 31 Urheberrechtsgesetz das einfache Nutzungsrecht, welches nur durch Zustimmung des Urhebers übertragen werden kann. Eine Bereitstellung zum uneingeschränkten Download in elektronischen Medien ist ohne gesonderte Zustimmung des Urhebers nicht gestattet.

Für die physikalische Einhaltung der prognostizierten Werte an den Immissionsorten können seitens des Gutachters keine Garantien übernommen werden. Die Ergebnisse basieren auf vom Auftraggeber und Anlagenhersteller zur Verfügung gestellten Angaben zum Standort und Betriebsverhalten der Windenergieanlagen und auf Berechnungen nach TA Lärm [1], den Empfehlungen des Arbeitskreises „Geräusche von Windenergieanlagen“ [6], der Norm DIN ISO 9613-2 [2] sowie den Hinweisen der Bund/Länder-Arbeitsgemeinschaft für Immissionsschutz (LAI) [11].

Akkreditierung

Die I17-Wind GmbH & Co. KG ist nach DIN EN ISO/IEC 17025:2018 durch die Deutsche Akkreditierungsstelle GmbH (DAkkS) für die Bereiche „Erstellen von Schallimmissionsprognosen für Windenergieanlagen; Erstellen von Schattenwurfimmissionsprognosen für Windenergieanlagen; Prüfung der Standort-eignung von Windenergieanlagen mittels Berechnung (Turbulenzgutachten)“ akkreditiert. Die Registriernummer der Urkunde lautet D-PL-21268-01-00. Diese kann angefragt, oder in der Datenbank der akkreditierten Stellen der DAkkS eingesehen werden.

Die I17-Wind GmbH & Co. KG ist Mitglied im Sachverständigenbeirat des Bundesverbandes WindEnergie (BWE) e.V.

1 Aufgabenstellung

Der Auftraggeber plant am Standort Krinitz-Steosow die Errichtung und den Betrieb von elf Windenergieanlagen (WEA) des Herstellers Vestas vom Typ V162-6.2 MW auf einer Nabenhöhe von 169.0 m [13]. Die geplanten WEA Standorte liegen in den Gemeindegebieten von Milow und Steosow im Landkreis Ludwigslust-Parchim in Mecklenburg-Vorpommern. In unmittelbarer Umgebung sowie im erweiterten Umfeld befinden sich weitere WEA in Betrieb und/oder im Genehmigungsverfahren und werden als Vorbelastung berücksichtigt [13.1, 13.2].

Eine WEA mit einer Gesamthöhe von mehr als 50 m stellt nach der 4. Bundes-Immissionsschutzverordnung eine genehmigungsbedürftige Anlage dar, welche das Genehmigungsverfahren nach dem Bundes-Immissionsschutzgesetz (BImSchG) [3] zu durchlaufen hat. Für das Genehmigungsverfahren nach dem BImSchG [3] ist der Nachweis der Einhaltung der gesetzlichen Richtwerte für die Schallimmissionen zu führen. Die Berechnungen sollen Auskunft darüber geben, ob schädliche Umwelteinwirkungen durch Geräusche gemäß der Technischen Anleitung zum Schutz gegen Lärm (TA Lärm) [1] von den geplanten Anlagen ausgehen können.

Zur Berechnung der Schallimmission ist gemäß Nr. A2 der TA Lärm [1] nach der DIN ISO 9613-2 [2] zu verfahren. Die DIN ISO 9613-2 gilt für die Berechnung der Schallausbreitung bei bodennahen Quellen. Der LAI empfiehlt in den Hinweisen zum Schallimmissionsschutz bei Windkraftanlagen Stand 30.06.2016 [11] zur Anpassung des Prognoseverfahrens auf hochliegende Quellen in Bezug auf die Veröffentlichung des Normenausschuss Akustik, Lärminderung und Schwingungstechnik (NALS) auf Basis neuerer Untersuchungsergebnisse und auf Basis theoretischer Berechnungen ein „Interimsverfahren“ [10]. Für WKA als hochliegende Schallquellen sind diese neueren Erkenntnisse im Genehmigungsverfahren entsprechend [11] zu berücksichtigen. Die Immissionsprognose ist daher nach der „Dokumentation zur Schallausbreitung – Interimsverfahren zur Prognose der Geräuschimmissionen von Windkraftanlagen, Fassung 2015-05.1“ [10] – sowohl für Vorbelastungsanlagen als auch für neu beantragte Anlagen – frequenzselektiv durchzuführen. Die überarbeiteten LAI-Hinweise sind nach [11.1] in Mecklenburg-Vorpommern anzuwenden.

2 Örtliche Beschreibung

Das Standortzentrum liegt im südwestlichen Teil der Gemeinde Milow im Landkreis Ludwigslust-Parchim in Mecklenburg-Vorpommern.

Im Nordosten bzw. Osten der geplanten WEA Standorte liegen die Ortschaften Deibow und Steosow ca. 2.0 km bzw. 3.0 km entfernt. Die Ortschaft Zuggelrade liegt südlich der Windparkplanung in einer Entfernung von ungefähr 2.0 km. Krinitz ist ca. 1.5 km westlich der vorgesehenen Fläche gelegen. Ebenso Gorlosen nördlich der Planung.

Die geplante Windparkfläche befindet sich auf landwirtschaftlich genutzten Feldern, die von Waldgebieten umgeben und von wenigen Baumreihen durchzogen sind.

Das Gelände um den Windpark ist eben und variiert in der Höhe nur geringfügig zwischen ca. 20 m und 30 m über NHN. Die Angaben zu den Geländehöhen wurden dem DGM 25 des Landes Mecklenburg-Vorpommern [12] entnommen.

Die Angaben zu den Koordinaten der geplanten Windenergieanlagen wurden vom Auftraggeber zur Verfügung gestellt [13].

Für die Koordinatangaben in diesem Gutachten findet das System UTM ETRS 89 Zone 33 Anwendung. Die Windenergieanlagenpositionen sind in der nachfolgenden Abbildung 2.1 dargestellt.

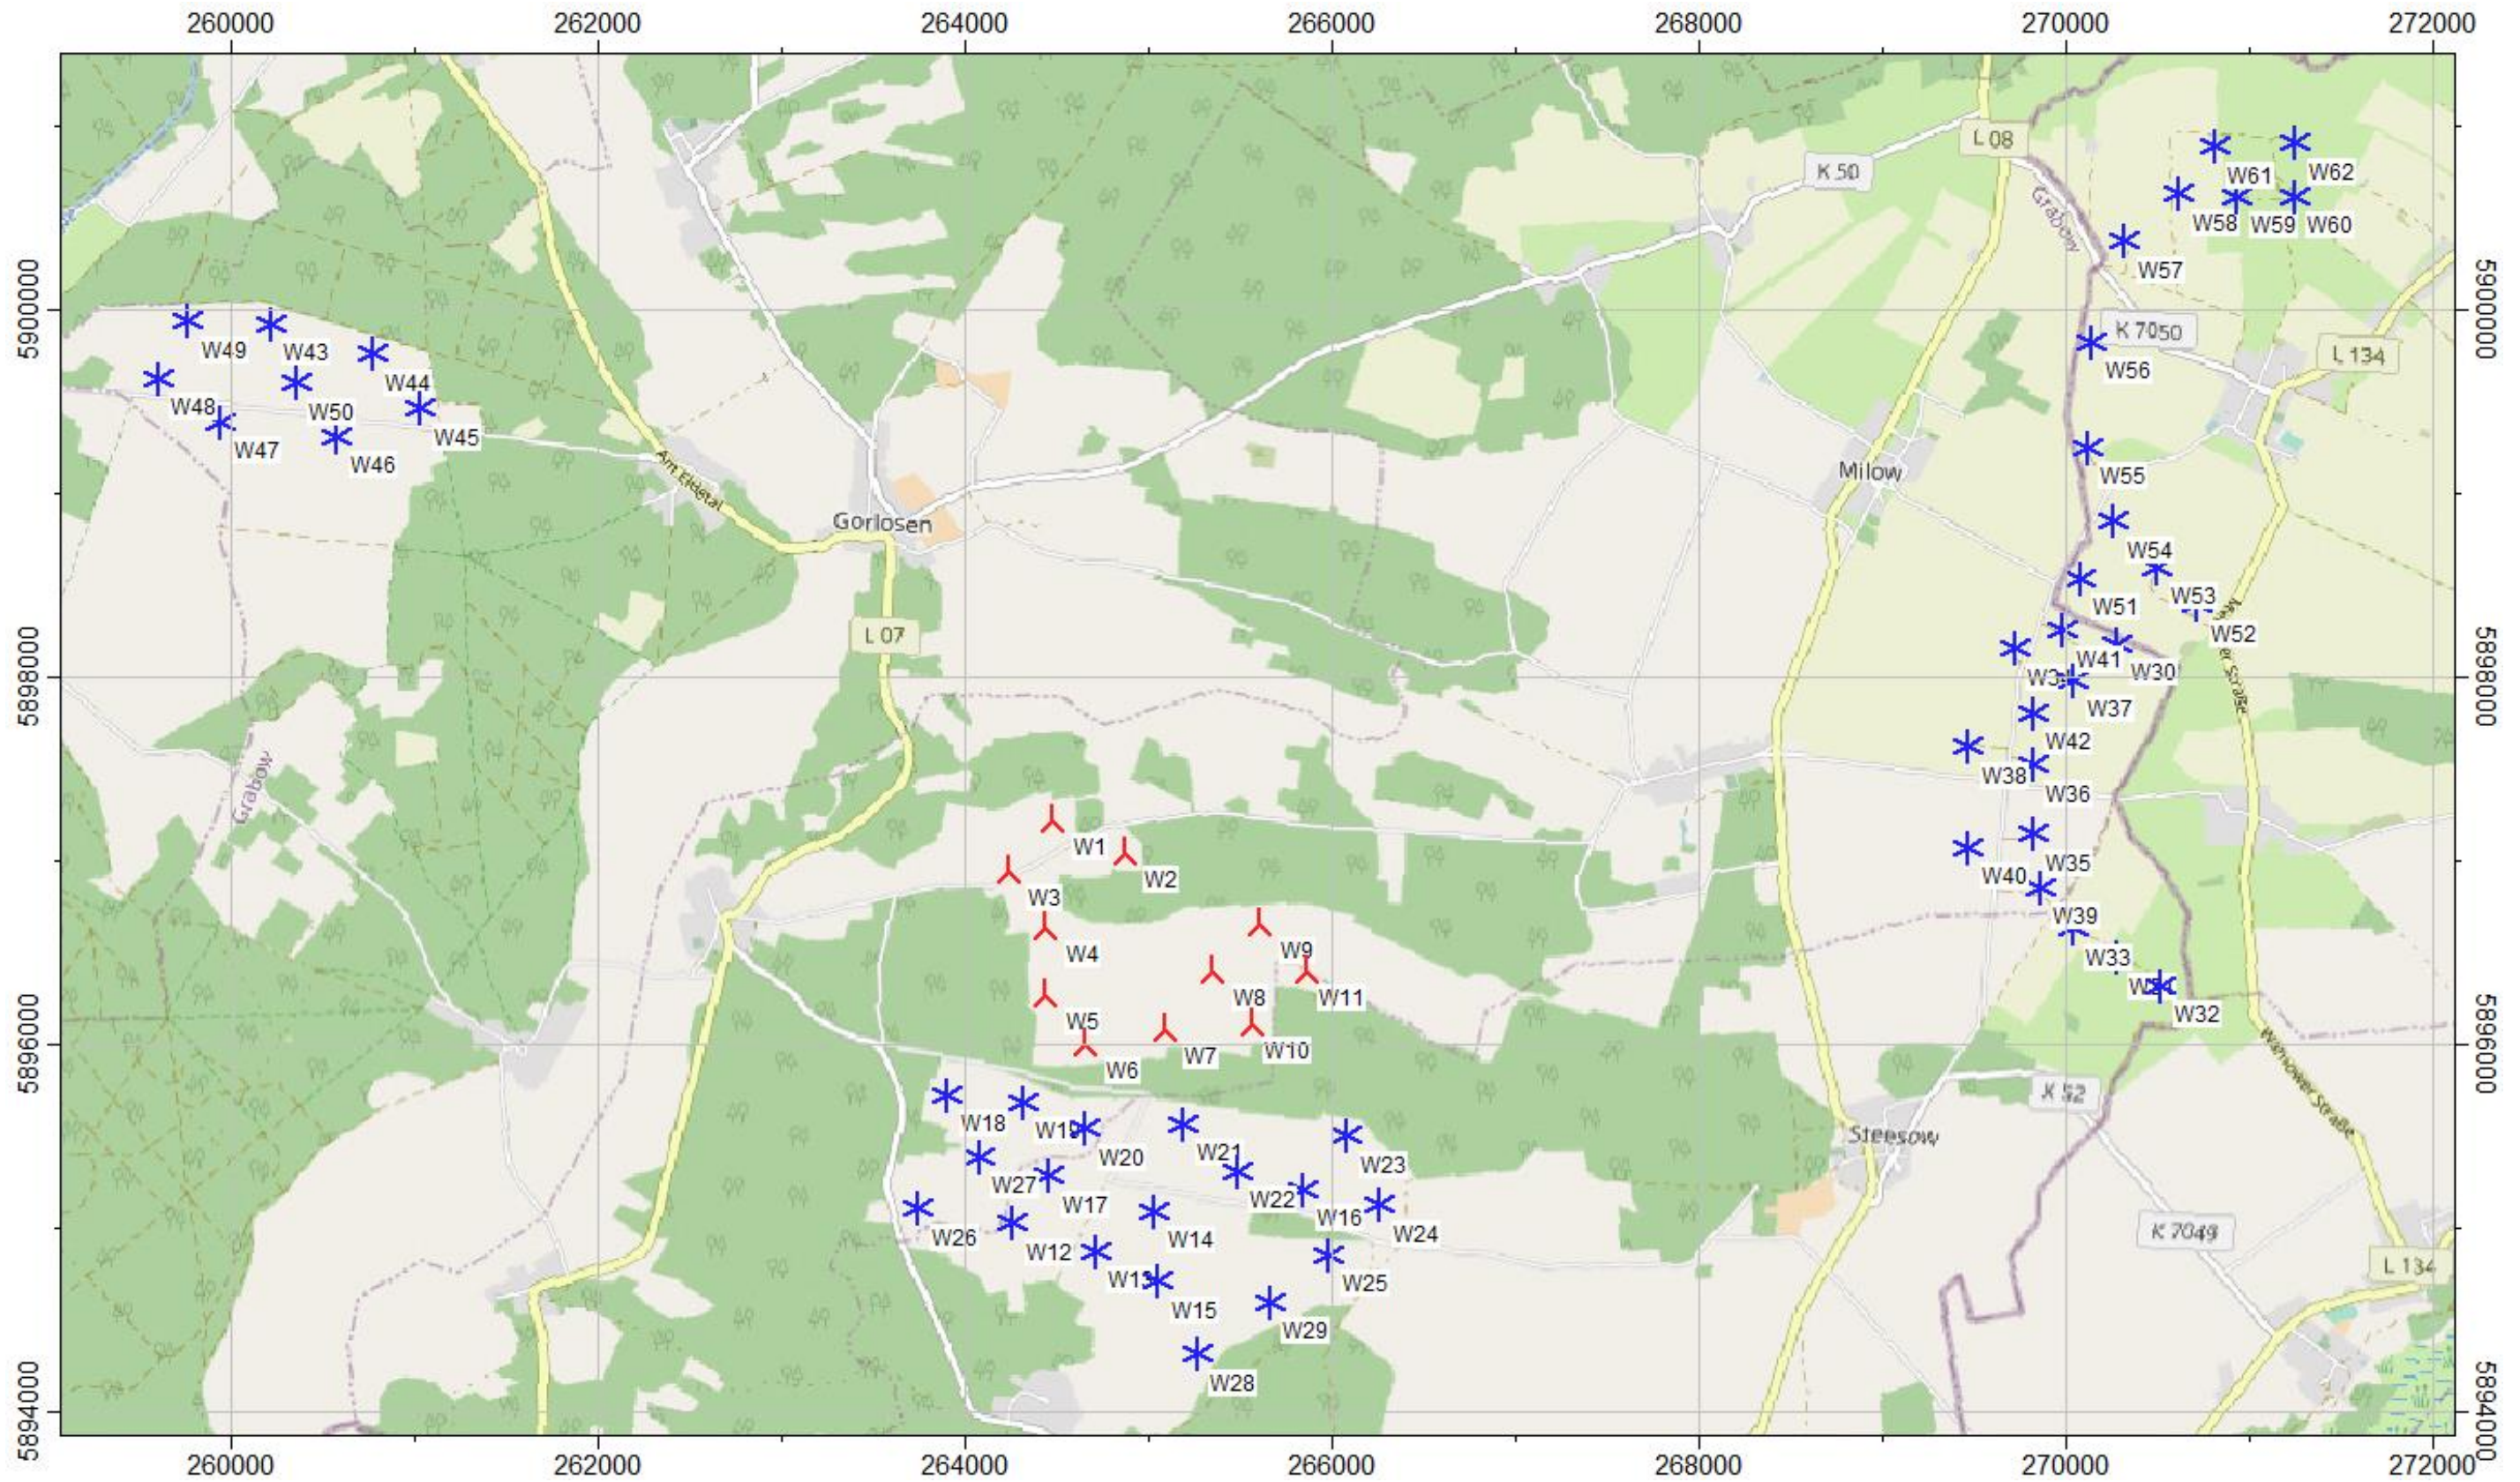

Abbildung 2.1: WEA Standorte; Kartenmaterial [8]

▲ = neu geplante WEA, * = bestehende WEA

3 Berechnungs- und Beurteilungsverfahren

Die gesetzliche Grundlage für die Schallimmissionsprognose bildet das Bundes-Immissionsschutzgesetz [3]. Die schalltechnischen Berechnungen wurden gemäß der TA-Lärm [1], der Norm DIN ISO 9613-2 [2], den Empfehlungen des Arbeitskreises „Geräusche von Windenergieanlagen“ [6] sowie den vom Auftraggeber und den Herstellern der Windenergieanlagen zur Verfügung gestellten Standort- und Anlagendaten durchgeführt. Des Weiteren werden das Interimsverfahren zur Prognose der Geräuschimmissionen von Windkraftanlagen [10] und der überarbeitete Entwurf der Hinweise zum Schallimmissionsschutz bei Windkraftanlagen (WKA) [11] vom 17.03.2016 mit Änderungen PhysE, Stand 30.06.2016, berücksichtigt und angewandt. Zur Anwendung kommt dabei das Softwareprogramm IMMI [9].

Für die Prognose von Immissionspegeln von Windkraftanlagen gibt es kein nationales Regelwerk, das ohne Einschränkungen, bzw. Modifizierungen oder Sonderregelungen auf die Schallausbreitung dieser hochliegenden Quellen anwendbar ist. Im Rahmen der Beurteilung der Geräuschbelastung dieser Anlagen wird in Genehmigungsverfahren im Regelfall die Anwendung der DIN ISO 9613-2 [2] vorgeschrieben. Diese Norm schließt aber explizit ihre Anwendung auf hochliegende Quellen aus.

Das „Interimsverfahren zur Prognose der Geräuschimmissionen von Windkraftanlagen [10]“ wurde im Mai 2015 veröffentlicht und basiert auf den Erkenntnissen des LANUV NRW zur Abweichung der realen von den modellierten Immissionen von WEA. Darauf aufbauend hat der LAI einen überarbeiteten Entwurf vom 17.03.2016 mit Änderungen PhysE vom 23.06.2016, Stand 30.06.2016, der Hinweise zum Schallimmissionsschutz bei Windkraftanlagen (WKA) [11] erarbeitet, der die Erkenntnisse der Studie aufgreift und, leicht adaptiert, in eine behördliche Empfehlung umsetzt (im Folgenden: neues LAI-Verfahren).

Durch eine im Interimsverfahren beschriebene Modifizierung des Schemas der DIN ISO 9613-2 [2] lässt sich dessen Anwendungsbereich auf Windkraftanlagen als hochliegende Quellen erweitern. Abweichend zum bisher in Deutschland üblichen Verfahren, sieht das Interimsverfahren vor, dass

- die Transmissionsberechnung auf Basis von Oktavband-Emissionsdaten der WEA frequenzselektiv durchgeführt wird (bisher: Summenpegel) und
- die Bodendämpfung A_{gr} pauschal -3 dB(A) beträgt (Betrachtung der WEA als hochliegende Schallquelle), anstatt wie bisher das Verfahren zur Bodendämpfung entsprechend DIN ISO 9613-2 anzusetzen.

Hierbei sind der Berechnung der Luftabsorption die Luftdämpfungskoeffizienten α nach Tabelle 2 der DIN ISO 9613-2 [2] für die relative Luftfeuchte 70 % und die Lufttemperatur von 10° C zugrunde zu legen.

Die ISO 9613-2 „Attenuation of sound during propagation outdoors, Part 2. A general method of calculation“ beschreibt die Berechnung der Dämpfung des Schalls bei der Ausbreitung im Freien. Der nachfolgende Text und die Gleichungen beschreiben den theoretischen Hintergrund der ISO 9613-2 wie sie in IMMI [9] Anwendung findet.

Normalerweise wird bei der schalltechnischen Vermessung von Windenergieanlagen der A-bewertete Schalleistungspegel in Form des 500-Hz-Mittenpegels ermittelt. Daher werden die Dämpfungswerte bei 500 Hz verwendet, um die resultierende Dämpfung für die Schallausbreitung abzuschätzen. Der Dauerschalldruckpegel jeder einzelnen Quelle am Immissionspunkt berechnet sich nach dem alternativen Verfahren der ISO 9613-2 dann wie folgt:

$$L_{AT}(DW) = L_{WA} + D_C - A - C_{met} \quad (1)$$

L_{WA} : Schalleistungspegel der Punktschallquelle A-bewertet.

D_C : Richtwirkungskorrektur für die Quelle ohne Richtwirkung (0 dB) aber unter Berücksichtigung der Reflexion am Boden, D_Ω (Berechnung nach dem alternativen Verfahren)

$$D_C = D_\Omega - 0 \quad (2)$$

D_Ω beschreibt die Reflexion am Boden und berechnet sich nach:

$$D_\Omega = 10 \lg\{1 + [d_p^2 + (h_s - h_r)^2] / [d_p^2 + (h_s + h_r)^2]\} \quad (3)$$

Mit:

h_s : Höhe der Quelle über dem Grund (Nabenhöhe)

h_r : Höhe des Immissionspunktes über Grund (standardmäßig 5 m)

d_p : Abstand zwischen Schallquelle und Empfänger, projiziert auf die Bodenebene. Der Abstand bestimmt sich aus den x und y Koordinaten der Quelle (Index s) und des Immissionspunktes (Index r):

$$d_p = \sqrt{(x_s - x_r)^2 + (y_s - y_r)^2} \quad (4)$$

A: Dämpfung zwischen der Punktquelle (WEA-Gondel) und dem Immissionspunkt, die während der Schallausbreitung vorhanden ist. Sie bestimmt sich aus den folgenden Dämpfungsarten:

$$A = A_{div} + A_{atm} + A_{gr} + A_{bar} + A_{misc} \quad (5)$$

A_{div} : Dämpfung aufgrund der geometrischen Ausbreitung

$$A_{div} = 20 \lg(d/d_0) + 11 \text{ dB} \quad (6)$$

d: Abstand zwischen Quelle und Immissionspunkt in Metern

d₀: Bezugsabstand = 1 m

A_{atm}: Dämpfung durch die Luftabsorption

$$A_{atm} = \alpha_{500} d / 1000 \quad (7)$$

α₅₀₀: Absorptionskoeffizient der Luft (= 1.9 dB/km)

Dieser Wert für α₅₀₀ bezieht sich auf die günstigsten Schallausbreitungsbedingungen (Temperatur von 10 °C und relativer Luftfeuchte von 70 %).

A_{gr}: Bodendämpfung

$$A_{gr} = (4.8 - (2h_m / d) [17 + (300 / d)]) \quad (8)$$

Wenn A_{gr} < 0 ist, dann ist A_{gr} = 0

h_m: mittlere Höhe (in Meter) des Schallausbreitungsweges über dem Boden

A_{bar}: Dämpfung aufgrund der Abschirmung (Schallschutz), in der vorliegenden Berechnung wird Schallschutz nicht verwendet: A_{bar} = 0.

A_{misc}: Dämpfung aufgrund verschiedener weiterer Effekte (Bewuchs: A_{fol}, Bebauung: A_{hous}, Industrie: A_{site}). In IMMI gehen diese Effekte (A_{fol}, A_{hous}) standardmäßig mit „= 0“ in die Prognose ein.

C_{met}: Meteorologische Korrektur, die durch die folgende Gleichung bestimmt wird:

$$C_{met} = 0 \text{ für } d_p < 10 (h_s + h_r) \quad (9)$$

$$C_{met} = C_0 [1 - 10 (h_s + h_r) / d_p] \text{ für } d_p > 10 (h_s + h_r) \quad (10)$$

d_p: Abstand zwischen Quelle und Aufpunkt

Faktor C_0 kann, abhängig von den Wetterbedingungen, zwischen 0 und 5 dB liegen, es ist jedoch in der Regel den beurteilenden Behörden vorbehalten, diesen Wert zu bestimmen.

Liegen den Berechnungen n Schallquellen (u.a. Windpark) zugrunde, so überlagern sich die einzelnen Schalldruckpegel L_{ATi} entsprechend der Abstände zum betrachteten Immissionspunkt. In der Bewertung der Lärmimmission nach der TA-Lärm ist der aus allen n Schallquellen resultierende Schalldruckpegel L_{AT} unter Berücksichtigung der Zuschläge nach der folgenden Gleichung zu ermitteln:

$$L_{AT}(LT) = 10 \lg \sum_{i=1}^n 10^{0,1(L_{ATi}-C_{met}+K_{Ti}+K_{ii})} \quad (11)$$

L_{AT} : Beurteilungspegel am Immissionspunkt

L_{ATi} : Schallimmissionspegel an dem Immissionspunkt einer Emissionsquelle i

i : Index für alle Geräuschquellen von 1 bis n

K_{Ti} : Zuschlag für Tonhaltigkeit einer Emissionsquelle i , abhängig von den lokalen Vorschriften

K_{ii} : Zuschlag für Impulshaltigkeit einer Emissionsquelle i abhängig von den lokalen Vorschriften

Nach der ISO 9613-2 [2] kann die Prognose der Schallimmissionen auch über das Oktavspektrum des Schallleistungspegels der WEA durchgeführt werden, wie es im Rahmen des Interimsverfahrens gefordert ist. Im Folgenden sind nur die Unterschiede zu der 500 Hz Mittenfrequenz bezogenen Berechnung aufgezeigt.

Der resultierende Schalldruckpegel L_{AT} berechnet sich dann mit:

$$L_{AT}(DW) = 10 \lg [10^{0,1L_{Aft}(63)} + 10^{0,1L_{Aft}(125)} + 10^{0,1L_{Aft}(250)} + 10^{0,1L_{Aft}(500)} + 10^{0,1L_{Aft}(1k)} + 10^{0,1L_{Aft}(2k)} + 10^{0,1L_{Aft}(4k)} + 10^{0,1L_{Aft}(8k)}] \quad (12)$$

Mit:

L_{Aft} : A-bewerteter Schalldruckpegel der einzelnen Schallquellen bei den unterschiedlichen Mittenfrequenzen (63, 125, 250, 500, 1000, 2000, 4000, 8000 Hz)

Der A-bewertete Schalldruckpegel L_{Aft} bei den Mittenfrequenzen jeder einzelnen Schallquelle berechnet sich aus:

$$L_{Aft}(DW) = (L_W + A_f) + D_C - A \quad (13)$$

Beim Interimsverfahren entfällt, im Gegensatz zum alternativen Verfahren nach der DIN ISO 9613-2 [2], der Term der meteorologischen Korrektur C_{met} , bzw. nimmt dieser den Wert $C_{met} = 0$ dB an.

Mit:

L_W : Oktav-Schallleistungspegel der Punktschallquelle nicht A-bewertet. $L_W + A_f$ entspricht dem A-bewerteten Oktav-Schallleistungspegel L_{WA} nach IEC 651.

A_f : genormte A-Bewertung nach IEC 651

D_c : Richtwirkungskorrektur für die Quelle ohne Richtwirkung (0 dB) aber mit Reflexion am Boden. Wenn das Standardverfahren zur Bodendämpfung verwendet wird, ist $D_c = 0$. Wenn die Alternative Methode verwendet wird, entspricht D_c dem Fall ohne Oktavbanddaten.

A : Oktavdämpfung, Dämpfung zwischen Punktquelle und Immissionspunkt. Sie bestimmt sich wie oben aus den folgenden Dämpfungsarten:

$$A = A_{div} + A_{atm} + A_{gr} + A_{bar} + A_{misc} \quad (14)$$

A_{div} : Dämpfung aufgrund der geometrischen Ausbreitung

A_{atm} : Dämpfung aufgrund der Luftabsorption, abhängig von der Frequenz

A_{gr} : Bodendämpfung

A_{bar} : Dämpfung aufgrund der Abschirmung (Schallschutz), worst case ohne $A_{bar} = 0$

A_{misc} : Dämpfung aufgrund verschiedener weiterer Effekte (Bewuchs: A_{fol} , Bebauung: A_{haus} , Industrie: A_{site} ; worst case $A_{misc} = 0$)

Bei der Oktavbandbezogenen Ausbreitung ist die Dämpfung durch die Luftabsorption von der Frequenz abhängig mit:

$$A_{atm} = \alpha_f d / 1000 \quad (15)$$

Mit:

α_f : Absorptionskoeffizient der Luft für jedes Oktavband

Der Absorptionskoeffizient α_f ist stark abhängig von der Schallfrequenz, der Umgebungstemperatur und der relativen Luftfeuchte. Die ungünstigsten Werte bestehen bei einer Temperatur von 10 °C und 70% Rel. Luftfeuchte entsprechend folgender Tabelle:

Tabelle 3.1: Luftdämpfungskoeffizienten α nach Tabelle 2 der DIN ISO 9613-2 für die relative Luftfeuchte 70 % und die Lufttemperatur von 10° C [2]

| Bandmittenfrequenz [Hz] | 63 | 125 | 250 | 500 | 1000 | 2000 | 4000 | 8000 |
|-------------------------|-----|-----|-----|-----|------|------|------|-------|
| α_f [dB/km] | 0.1 | 0.4 | 1.0 | 1.9 | 3.7 | 9.7 | 32.8 | 117.0 |

Zur Berechnung der Bodendämpfung A_{gr} existieren zwei Möglichkeiten: das alternative Verfahren, das oben im Kapitel über das Berechnungsverfahren ohne Oktavbanddaten dargelegt wurde, und das Standardverfahren. Das Standardverfahren berechnet A_{gr} wie folgt:

$$A_{gr} = A_s + A_r + A_m \quad (16)$$

Mit:

A_s : Die Dämpfung für die Quellregion bis zu einer Entfernung von $30h_s$, maximal aber d_p . Diese Region wird mit dem Bodenfaktor G_s beschrieben, der die Porosität der Oberfläche als Wert zwischen 0 (hart) und 1 (porös) wiedergibt.

A_r : Aufpunkt-Region bis zu einer Entfernung von $30h_r$, maximal aber d_p . Diese Region wird mit dem Bodenfaktor G_r beschrieben

A_m : Die Dämpfung der Mittelregion. Wenn die Quell- und die Aufpunkt-Region überlappen, gibt es keine Mittelregion. Diese Region wird mit dem Bodenfaktor G_m beschrieben

Die wesentliche Modifikation durch das Interimsverfahren [10, 11], besteht nun darin, für die Bodendämpfung $A_{gr} = -3$ dB anzusetzen. Sie berücksichtigt, dass es bei der Windkraftanlage als hochliegende Quelle zu lediglich einer Bodenreflexion kommt und deshalb die Ansätze der DIN ISO 9613-2 nicht greifen können.

Für eine evtl. vorliegende Vorbelastung durch Windenergieanlagen wurde für die Berechnung der Schallvorbelastung nach dem Interimsverfahren in einem ersten Schritt aus den behördlich genehmigten Schalleistungspegeln und den Angaben zum Zuschlag im Sinne des Oberen Vertrauensbereichs mit Hilfe des Referenzspektrums [11] aus Tabelle 3.2 ein Oktavspektrum für jede als Vorbelastung zu betrachtende WEA ermittelt. Lagen qualifizierte Informationen über detaillierte anlagenbezogene Oktavspektren der behördlich genehmigten Schalleistungspegel der Vorbelastungsanlagen vor, wurden diese entsprechend herangezogen und der Zuschlag im Sinne des Oberen Vertrauensbereichs wurde

auf die einzelnen Frequenzbereiche des Oktavspektrums hinzuaddiert. In beiden Fällen wurden somit die Unsicherheiten der Emissionsdaten der Vorbelastungsanlagen in gleicher Weise berücksichtigt, wie sie im Rahmen der Genehmigung der Vorbelastungsanlagen ermittelt und angewandt wurden.

Tabelle 3.2: Referenzspektrum [11]

| Referenzspektrum | | | | | | | | |
|----------------------|-------|-------|------|------|------|------|-------|--------------------|
| f [Hz] | 63 | 125 | 250 | 500 | 1000 | 2000 | 4000 | 8000 |
| L _{WA,norm} | -20.3 | -11.9 | -7.7 | -5.5 | -6.0 | -8.0 | -12.0 | -20.0 ¹ |

¹ Die Anforderungen für den, in den LAI-Hinweisen Stand 30.06.2016, fehlenden Wert bei 8 kHz unterscheiden sich in den Bundesländern. Im vorliegenden Gutachten wurde der Wert auf -20 dB festgelegt. Dies stellt eine konservative Annahme dar und deckt somit die bekannten Anforderungen ab.

4 Immissionsorte

Die Auswahl der Immissionsorte wurde im ersten Schritt auf Basis des nach TA Lärm definierten Einwirkungsbereichs der geplanten WEA vorgenommen. Der Einwirkungsbereich ist definiert als der Bereich in dem der Beurteilungspegel der Zusatzbelastung weniger als 10 dB(A) unter dem maßgebenden Immissionsrichtwert liegt [1]. Als repräsentative schallkritische Immissionsorte wurden die nächstgelegenen Wohnbebauungen gewählt.

Es existiert keine gültige Bauleitplanung, aus der die Gebietseinstufung der einzelnen Ortsteile hervorgeht. Die Immissionsorte wurden daher nach dem tatsächlichen Nutzen eingestuft.

Demnach befindet sich der Immissionsort IO3 und IO7 im Außenbereich mit einem Immissionsrichtwert von 45 dB(A) im Beurteilungszeitraum Nacht.

Die Ortsteile Gorlosen, Milow, Deibow, Steesow, Bochin, Zuggelrade, Görnitz und Krinitz weisen Charakteristiken eines Dorf- Mischgebietes auf. Neben vorhandenen Wohngebäuden sind größere Schuppen und Hallen sowie Gebäude vorzufinden, die der Unterbringung von größeren Geräten dienen könnten. Oftmals sind größere freie und eingezäunte Flächen zu sehen, die zur Haltung von Tieren vorgesehen sind oder landwirtschaftlich genutzt werden könnten. Demzufolge werden die Immissionsorte IO1, IO2, IO4 bis IO6 und IO8 bis IO17 als Dorf- und Mischgebiet eingestuft und ebenfalls mit einem Immissionsrichtwert von 45 dB(A) im Beurteilungszeitraum Nacht im vorliegenden Gutachten berücksichtigt.

Während einer Standortbesichtigung am 03.12.2022 durch einen Mitarbeiter der I17-Wind GmbH & Co. KG wurde die bestehende Wohnbebauung mit Angaben aus dem Kartenmaterial abgeglichen und Abweichungen dokumentiert und korrigiert.

Die Immissionspegel werden standardmäßig bei einer Aufpunkthöhe von 5 m ermittelt. Das entspricht in der Regel der Höhe einer ersten Etage eines Wohnhauses. Wird hierbei der erforderliche Richtwert eingehalten, reduziert sich der Immissionspegel bei einer geringeren Aufpunkthöhe wie z.B. im Erdgeschoss. Bei allen Immissionsorten, mit Ausnahme von IO10, wurde die Aufpunkthöhe auf 5 m gesetzt. Für den Immissionsort IO10 wurde die Aufpunkthöhe auf 7 m festgelegt.

Die Immissionsorte wurden auch hinsichtlich möglicher Pegelerhöhungen durch Reflexionen untersucht. Das Ergebnis dieser Untersuchung zeigt, dass es keinen Immissionsort im Einwirkungsbereich gibt, bei welchem eine relevante Pegelerhöhung auf Grund von Reflexionen an anderen Gebäuden oder Wänden berücksichtigt werden müsste.

In der nachfolgenden Tabelle 4.1 und Abbildung 4.1 sind die berücksichtigten Immissionsorte aufgelistet, bzw. dargestellt.

Tabelle 4.1: Immissionsorte

| Nr. | Bezeichnung | IRW [dB(A)] | | | UTM ETRS89 Zone 33 | | Höhe über NHN [m] | Aufpunkt- höhe über Grund [m] |
|------|--|-------------------|-------------------|-----------------|--------------------|---------|----------------------------|--|
| | | Werktag 6h-22h | Sonntag 6h-22h | Nacht 22h-6h | X [m] | Y [m] | | |
| | | | | | | | | |
| IO1 | Lenzener Str. 10, 19294 Gorlosen | 60 | 60 | 45 | 263613 | 5898622 | 5 | 28 |
| IO2 | Lenzener Str. 12, 19294 Gorlosen | 60 | 60 | 45 | 263778 | 5898669 | 5 | 27 |
| IO3 | Neuhof 3, 19294 Gorlosen | 60 | 60 | 45 | 264813 | 5899264 | 5 | 30 |

5 Beschreibung der geplanten Windenergieanlagen

5.1 Anlagenbeschreibung

Der Auftraggeber plant am Standort Krinitz-Steesow die Errichtung und den Betrieb von elf Windenergieanlagen des Herstellers Vestas Wind Systems A/S. Nachfolgend werden die Eckdaten der geplanten Windenergieanlagen zusammengefasst:

| | |
|-------------------|-------------------------|
| Hersteller: | Vestas Wind Systems A/S |
| Anlagentyp: | V162-6.2 MW |
| Nabenhöhe: | 169 m |
| Rotordurchmesser: | 162 m |
| Nennleistung: | 6.200 kW |
| Regelung: | pitch |

5.2 Positionen der geplanten Windenergieanlagen

Die Angaben zu den Koordinaten wurden vom Auftraggeber übermittelt [13]. Der nachfolgenden Tabelle 5.1 sind die Position, der Anlagentyp mit Nabenhöhe und die Betriebsweise der geplanten Windenergieanlagen zu entnehmen. Die Betriebsweisen und die damit verbundenen Schallleistungspegel der Windenergieanlagen bilden die Grundlage für die Berechnung der Zusatzbelastung am Standort Krinitz-Steesow.

Tabelle 5.1: Positionen der geplanten WEA [13]

| W-Nr. | Bez. Auftraggeber | Typ | Nabenhöhe [m] | UTM ETRS89 Zone 33 | | Höhe über NHN [m] | Betriebsweise Tag | Betriebsweise Nacht |
|-------|-------------------|-------------|---------------|--------------------|---------|-------------------|-------------------|---------------------|
| | | | | X [m] | Y [m] | | | |

5.3 Schalltechnische Kennwerte

Für die Vestas V162-6.2 MW existierten zum Zeitpunkt der Berichterstellung keine unabhängigen schalltechnischen Vermessungen nach DIN EN 61400-11 [5] und der Technischen Richtlinie für Windenergieanlagen, Teil 1 „Bestimmung der Schallemissionswerte“ [4]. Der Anlagenhersteller gibt für den Betrieb in Deutschland nachfolgende Angaben zu den maximalen Schalleistungspegeln für die unterschiedlichen Betriebsweisen der Anlage an.

Tabelle 5.2: Betriebsvarianten V162-6.2 MW [14]

| Herstellerbezeichnung der Betriebsvariante | Dokumentenbezeichnung | Nennleistung [kW] | Schalleistungspegel [dB(A)] |
|--|-----------------------|-------------------|-----------------------------|
| PO6200 | 0079-9518.V09 [14] | 6.200 | 104.8 |
| PO6000 | | 6.000 | 104.3 |
| PO5600 | | 5.600 | 104.0 |
| SO2 | | 5.057 | 102.0 |
| SO3 | | 4.841 | 101.0 |
| SO4 | | 4.566 | 100.0 |
| SO5 | | 4.255 | 99.0 |
| SO6* | | 3.622 | 98.0 |

**projektspezifische Freigabe erforderlich*

5.3.1 Eingangskenngrößen für Schallimmissionsprognosen

In sind die Oktavspektren der relevanten Betriebsweisen dargestellt [14], welche aus den Herstellerangaben entnommen wurde und zum jeweils maximalen, immissionsrelevanten Schallleistungspegel in der zugehörigen Betriebsweise führt und für die Prognose nach dem Interimsverfahren [11, 12] Anwendung fand. Zudem wird das Oktavband für den $L_{e,max}$ der relevanten Betriebsweisen der geplanten WEA dargestellt, welches nach Abschnitt 4.1 aus [11] im Genehmigungsbescheid festzuschreiben ist und die Unsicherheiten der Emissionsdaten als Toleranzbereich berücksichtigt, siehe Kapitel 10 (Qualität der Prognose). Das den Berechnungen zu Grunde liegende Oktavspektrum inkl. aller Unsicherheiten ($L_{WA\text{ inkl. OVB, Okt}}$) wird ebenfalls dargestellt.

Tabelle 5.3 sind die Oktavspektren der relevanten Betriebsweisen dargestellt [14], welche aus den Herstellerangaben entnommen wurde und zum jeweils maximalen, immissionsrelevanten Schallleistungspegel in der zugehörigen Betriebsweise führt und für die Prognose nach dem Interimsverfahren [11, 12] Anwendung fand. Zudem wird das Oktavband für den $L_{e,max}$ der relevanten Betriebsweisen der geplanten WEA dargestellt, welches nach Abschnitt 4.1 aus [11] im Genehmigungsbescheid festzuschreiben ist und die Unsicherheiten der Emissionsdaten als Toleranzbereich berücksichtigt, siehe Kapitel 10 (Qualität der Prognose). Das den Berechnungen zu Grunde liegende Oktavspektrum inkl. aller Unsicherheiten ($L_{WA\text{ inkl. OVB, Okt}}$) wird ebenfalls dargestellt.

Tabelle 5.3: Oktavband V162-6.2 MW [14]

| Modus | Bez. Spektrum | SLP [dB(A)] | Oktav-Schalleistungspegel (Herstellerangabe) | | | | | | | |
|--------|---|-------------|--|----------|----------|----------|-----------|-----------|-----------|-----------|
| | | | 63 [Hz] | 125 [Hz] | 250 [Hz] | 500 [Hz] | 1000 [Hz] | 2000 [Hz] | 4000 [Hz] | 8000 [Hz] |
| PO6200 | $L_{WA,Okt}$ | 104.8 | 86.1 | 93.6 | 98.2 | 99.9 | 98.8 | 94.7 | 87.8 | 78.0 |
| | berücksichtigte Unsicherheiten: $\sigma_R = 0.5\text{ dB}$ $\sigma_P = 1.2\text{ dB}$ $\sigma_{Prog} = 1.0\text{ dB}$ | | | | | | | | | |
| | $L_{e,max,Okt}$ | 106.5 | 87.8 | 95.3 | 99.9 | 101.6 | 100.5 | 96.4 | 89.5 | 79.7 |
| | $L_{WA\text{ inkl. OVB, Okt}}$ | 106.9 | 88.2 | 95.7 | 100.3 | 102.0 | 100.9 | 96.8 | 89.9 | 80.1 |
| PO5600 | $L_{WA,Okt}$ | 104.0 | 84.8 | 92.5 | 97.3 | 99.2 | 98.0 | 93.9 | 86.8 | 76.7 |
| | berücksichtigte Unsicherheiten: $\sigma_R = 0.5\text{ dB}$ $\sigma_P = 1.2\text{ dB}$ $\sigma_{Prog} = 1.0\text{ dB}$ | | | | | | | | | |
| | $L_{e,max,Okt}$ | 105.7 | 86.5 | 94.2 | 99.0 | 100.9 | 99.7 | 95.6 | 88.5 | 78.4 |
| | $L_{WA\text{ inkl. OVB, Okt}}$ | 106.1 | 86.9 | 94.6 | 99.4 | 101.3 | 100.1 | 96.0 | 88.9 | 78.8 |
| SO2 | $L_{WA,Okt}$ | 102.0 | 82.9 | 90.6 | 95.4 | 97.1 | 96.0 | 91.9 | 84.8 | 74.7 |
| | berücksichtigte Unsicherheiten: $\sigma_R = 0.5\text{ dB}$ $\sigma_P = 1.2\text{ dB}$ $\sigma_{Prog} = 1.0\text{ dB}$ | | | | | | | | | |
| | $L_{e,max,Okt}$ | 103.7 | 84.6 | 92.3 | 97.1 | 98.8 | 97.7 | 93.6 | 86.5 | 76.4 |
| | $L_{WA\text{ inkl. OVB, Okt}}$ | 104.1 | 85.0 | 92.7 | 97.5 | 99.2 | 98.1 | 94.0 | 86.9 | 76.8 |
| SO4 | $L_{WA,Okt}$ | 100.0 | 80.9 | 88.7 | 93.4 | 95.1 | 94.0 | 89.8 | 82.8 | 72.6 |
| | berücksichtigte Unsicherheiten: $\sigma_R = 0.5\text{ dB}$ $\sigma_P = 1.2\text{ dB}$ $\sigma_{Prog} = 1.0\text{ dB}$ | | | | | | | | | |
| | $L_{e,max,Okt}$ | 101.7 | 82.6 | 90.4 | 95.1 | 96.8 | 95.7 | 91.5 | 84.5 | 74.3 |
| | $L_{WA\text{ inkl. OVB, Okt}}$ | 102.1 | 83.0 | 90.8 | 95.5 | 97.2 | 96.1 | 91.9 | 84.9 | 74.7 |

Das den Berechnungen zu Grunde liegende Oktavspektrum ($L_{WA\text{ inkl. OVB, Okt}}$) der jeweiligen Betriebsweise für die geplanten Anlagen kann den Ausdrucken im Anhang 1 des Gutachtens entnommen werden.

5.4 Ton- und Impulshaltigkeit

Für die geplanten Anlagentypen V162-6.2 MW weisen die Herstellerangaben [14] keine zu berücksichtigenden Ton- und Impulshaltigkeiten aus

Auftretende Tonhaltigkeiten von $K_{TN} < 2$ dB(A) müssen nach den LAI-Hinweisen [11] Punkt 4.5 nicht berücksichtigt werden. Es gilt:

Falls die Anlage nach den Planungsunterlagen im Nahbereich eine geringe Tonhaltigkeit ($K_{TN} = 2$ dB) aufweist, ist am maßgeblichen Immissionsort eine Abnahme zur Überprüfung der dort von der Anlage verursachten Tonhaltigkeit zu fordern. Sofern im Rahmen einer emissionsseitigen Abnahmemessung eine geringe Tonhaltigkeit festgestellt wird, ist ebenfalls im Rahmen einer Immissionsseitigen Abnahmemessung deren Immissionsrelevanz zu untersuchen [11].

Des Weiteren wird davon ausgegangen, dass immissionsrelevante Ton- und Impulshaltigkeiten bei Windenergieanlagen nicht den Stand der Technik widerspiegeln und somit nicht genehmigungsfähig wären.

6 Fremdgeräusche

An Bäumen und Sträuchern können durch Wind verursachte Geräusche entstehen. Dies kann dazu führen, dass die Geräusche der WEA verdeckt werden. Fremdgeräusche entstehen ebenfalls durch Straßenverkehr.

7 Tieffrequente Geräusche

Die Messung und Beurteilung tieffrequenter Geräusche sind in der Technischen Anleitung zum Schutz gegen Lärm (TA Lärm [1], siehe dort das Kapitel 7.3 und den Anhang A 1.5) sowie in der Norm DIN 45680 geregelt. Maßgeblich für mögliche Belästigungen ist die Wahrnehmungsschwelle des Menschen, die in der Norm dargestellt ist. An Immissionsorten wird diese Schwelle aufgrund der großen Entfernung zwischen den Immissionsorten und den geplanten WEA nach Erfahrungen des Arbeitskreises Geräusche von WEA der Fördergesellschaft Windenergie e.V. nicht erreicht.

Ein Messprojekt „Tieffrequente Geräusche inkl. Infraschall von Windkraftanlagen und anderen Quellen“ der Landesanstalt für Umwelt, Messungen und Naturschutz Baden-Württemberg zwischen 2013 und 2015 [7] zeigte, dass Windenergieanlagen keinen wesentlichen Beitrag zum Infraschall leisten. Die von ihnen erzeugten Infraschallpegel liegen, auch im Nahbereich bei Abständen zwischen 150 und 300 m, deutlich unterhalb der Wahrnehmungsschwelle des Menschen. Bei einem Abstand von 700 m von den Windenergieanlagen lässt sich festhalten, dass sich der Infraschall-Pegel beim Einschalten der Anlage nicht mehr nennenswert erhöht und im Wesentlichen vom Wind, und nicht von der Windenergieanlage, erzeugt wurde.

Nach heutigem Stand der Wissenschaft sind schädliche Wirkungen durch Infraschall bei Windenergieanlagen nicht zu erwarten.

8 Vorbelastung

In unmittelbarer Umgebung sowie im erweiterten Umfeld der geplanten Anlagen sind weitere WEA in Betrieb und/oder im Genehmigungsverfahren, die es zu berücksichtigen gilt [13, 13.1].

Für die Berechnungen der Vorbelastung nach dem Interimsverfahren [10] wurden als Eingangsdaten zunächst, sofern bekannt, die genehmigten Schalleistungspegel und Oktavspektren aus [13.1] zu Grunde gelegt.

Für die Bestandsanlagen W28 bis W50 lagen behördenseitig Informationen zu den Schalleistungspegeln und Oktavspektren vor [13.1]. Für die W51 bis W62 wurden lediglich die Schalleistungspegel übermittelt. Die angesetzten Oktavspektren wurden aus Messberichten entnommen und auf den übermittelten Schalleistungspegel inkl. anzunehmenden Unsicherheiten normiert [15, 15.1].

Für die W30 bis W33, W37 und W42 lagen ebenfalls keine Informationen über die Oktavbänder für den Tagbetrieb vor. Aufgrund fehlender Messberichte und Herstellerangaben wurde für die Bildung des Oktavbands auf das Referenzspektrum aus den LAI-Hinweisen [11] zurückgegriffen.

Die folgende Tabelle 8.1 führt die Bestandsanlagen mit den genehmigten bzw. zu Grunde gelegten Schalleistungspegeln inklusive der anzusetzenden Zuschläge für den oberen Vertrauensbereich auf.

Tabelle 8.1: Positionen und Schalleistungspegel der Bestandsanlagen [13, 13.1]

| W-Nr. | Typ | Nabenhöhe [m] | UTM ETRS89 Zone 33 | | Höhe über NHN [m] | L _{WA} (Tag) [dB(A)] | L _{WA} (Nacht) [dB(A)] |

9 Rechenergebnisse und Beurteilungen

9.1 Zusatzbelastung

In der nachfolgenden Tabelle 9.1 sind die Ergebnisse der Ermittlung der nächtlichen Immissionspegel für die **Zusatzbelastung**, berechnet nach dem Interimsverfahren [10], inklusive möglicher Zuschläge für Tageszeiten mit erhöhter Empfindlichkeit in Gebieten nach Nummer 6.1 Buchstaben e bis g der TA Lärm [1], dargestellt. Zur Anwendung kamen die in Tabelle 5.1 angegebenen Betriebsweisen mit den in sind die *Oktavspektren der relevanten Betriebsweisen dargestellt [14], welche aus den Herstellerangaben entnommen wurde und zum jeweils maximalen, immissionsrelevanten Schalleistungspegel in der zugehörigen Betriebsweise führt und für die Prognose nach dem Interimsverfahren [11, 12] Anwendung fand. Zudem wird das Oktavband für den $L_{e,max}$ der relevanten Betriebsweisen der geplanten WEA dargestellt, welches nach Abschnitt 4.1 aus [11] im Genehmigungsbescheid festzuschreiben ist und die Unsicherheiten der Emissionsdaten als Toleranzbereich berücksichtigt, siehe Kapitel 10 (Qualität der Prognose). Das den Berechnungen zu Grunde liegende Oktavspektrum inkl. aller Unsicherheiten (L_{WA} inkl. $OV_B, Okt.$) wird ebenfalls dargestellt.*

Tabelle 5.3 angegebenen Oktavspektren zzgl. eines Zuschlages für die Unsicherheiten entsprechend den LAI-Hinweisen [11].

10 Qualität der Prognose

Für eine Schallimmissionsprognose fordert die TA Lärm [1] eine Aussage über die Qualität der Prognose. Art und Umfang der Prognosequalität werden nicht näher spezifiziert.

Die der Schallimmissionsprognose nach DIN ISO 9613-2 [2] sowie dem Interimsverfahren inklusive den Hinweisen des LAI [10, 11] zu Grunde zu legenden Emissionswerte sind, im Sinne der Statistik, Schätzwerte. Bei der Prognose ist daher auf die Sicherstellung der "Nicht-Überschreitung" der Immissionsrichtwerte im Sinne der Regelungen der TA Lärm abzustellen. Dieser Nachweis soll mit einer Wahrscheinlichkeit von 90 % geführt werden. Die Sicherstellung der "Nicht-Überschreitung" ist insbesondere dann anzunehmen, wenn die, unter Berücksichtigung der Unsicherheit der Emissionsdaten und der Unsicherheit der Ausbreitungsrechnung bestimmte, obere Vertrauensbereichsgrenze des prognostizierten Beurteilungspegels den IRW unterschreitet.

Nach dem überarbeiteten Entwurf vom 17.03.2016 mit Änderungen PhysE vom 23.06.2016, Stand 30.06.2016, der Hinweise zum Schallimmissionsschutz bei Windkraftanlagen (WKA) [11] sind bei WEA die als Vorbelastung zu berücksichtigen sind, die in ihrer Genehmigung festgelegten zulässigen Schallleistungspegel zu verwenden.

Die Schallimmissionsprognose nach den LAI Hinweisen zum Schallimmissionsschutz bei Windkraftanlagen, Stand 30.06.2016 [11], und der Dokumentation zur Schallausbreitung – Interimsverfahren zur Prognose der Geräuschimmissionen von Windkraftanlagen, Fassung 2015-05.1“ [10], ist mit der Unsicherheit der Emissionsdaten (Unsicherheit der Typvermessung σ_R und Unsicherheit der Serienstreuung σ_P) sowie der Unsicherheit des Prognosemodells σ_{Prog} behaftet.

Unsicherheit der Typvermessung σ_R :

Bei einer normkonform nach FGW-Richtlinie durchgeführten Typvermessung kann von einer Unsicherheit $\sigma_R = 0.5$ dB ausgegangen werden.

Unsicherheit durch Serienstreuung σ_P :

Bei der Übertragung des an einer WEA vermessenen Schallleistungspegels auf eine andere WEA des gleichen Typs ergibt sich eine Unsicherheit durch die Streuung der in Serie hergestellten WEA. Bei einer Mehrfachvermessung aus mindestens drei Messungen kann für σ_P die Standardabweichung s der Messwerte aus dem zusammenfassenden Bericht angesetzt werden.

Liegt eine Mehrfachvermessung des Anlagentyps in einer anderen als der beantragten Betriebsweise vor, kann die durch die Mehrfachvermessung dokumentierte Serienstreuung auch auf die beantragte Betriebsweise übertragen werden. In diesem Fall wird eine Abnahmemessung empfohlen. Liegt keine Mehrfachvermessung vor, ist für σ_P ein Ersatzwert von 1.2 dB zu wählen.

Beim Heranziehen einer Herstellerangabe zum Schallleistungspegel, bzw. zum Oktavspektrum, für die Immissionsprognose gilt es zu überprüfen, in wie fern der Hersteller die anzusetzenden Unsicherheiten für die Emissionsdaten (σ_R und σ_P) für eine spätere Vermessung separat ausgewiesen hat. Liegen keine gesonderten Informationen vor, werden die Werte der LAI-Hinweise [11] für $\sigma_R = 0.5$ dB und $\sigma_P = 1.2$ dB angesetzt.

Maximal zulässiger Emissionswert $L_{e,max}$:

$$L_{e,max} = \bar{L}_W + 1.28 * \sqrt{\sigma_R^2 + \sigma_P^2}$$

$L_{e,max}$: Maximal zulässiger Emissionspegel

\bar{L}_W : Mittlerer Schalleistungspegel

σ_R : Unsicherheit der Typvermessung

σ_P : Unsicherheit durch Serienstreuung

Im Genehmigungsbescheid ist der in der Prognose angesetzte Schalleistungspegel $L_{e,max}$ festzuschreiben, siehe Kapitel 0.

Unsicherheit des Prognosemodells σ_{Prog} :

Die Unsicherheit des Prognosemodells wird wie folgt berücksichtigt:

$$\sigma_{Prog} = 1 \text{ dB}$$

Die einzelnen Unsicherheiten können in der Standardabweichung für die Gesamtunsicherheit σ_{ges} wie folgt zusammengefasst werden:

$$\sigma_{ges} = \sqrt{\sigma_R^2 + \sigma_P^2 + \sigma_{Prog}^2}$$

Mit Hilfe der Gesamtunsicherheit, kann die obere Vertrauensbereichsgrenze der prognostizierten Immission (mit einem Vertrauensniveau von 90 %) durch einen Zuschlag abgeschätzt werden, der folgendermaßen berechnet wird:

$$\Delta L = 1.28 \sigma_{ges}$$

Entgegen der beschriebenen Verfahrensweise wird der obere Vertrauensbereich bei einer Irrtumswahrscheinlichkeit von 10 %, bzw. mit einer 90 % Einhaltungswahrscheinlichkeit ($OVB = \Delta L = 1.28 \sigma_{ges}$) emissionsseitig auf jeden Oktavpegel des Oktavspektrums der WEA addiert.

Tabelle 10.1 führt den Unsicherheitszuschlag auf, welcher im Rahmen der Prognose nach dem Interimsverfahren für die geplanten WEA anzusetzen ist.

Tabelle 10.1: Unsicherheiten und verwendete Emissionswerte der Windenergieanlagen

| Typ | Mode | L _{WA} Mittel [dB(A)] | Quelle | σ_R [dB(A)] | σ_P [dB(A)] | σ_{Prog} [dB(A)] | σ_{ges} [dB(A)] | OVB [dB(A)] | L _{WA} inkl. OVB [dB(A)] |
|-------------|--------|-----------------------------------|--------|-----------------------|-----------------------|-----------------------------------|----------------------------------|----------------|--------------------------------------|
| V162-6.2 MW | PO6200 | 104.8 | [14] | 0.5 | 1.2 | 1.0 | 1.64 | 2.1 | 106.9 |
| | PO5600 | 104.0 | [14] | 0.5 | 1.2 | 1.0 | 1.64 | 2.1 | 106.1 |
| | SO2 | 102.0 | [14] | 0.5 | 1.2 | 1.0 | 1.64 | 2.1 | 104.1 |
| | SO4 | 100.0 | [14] | 0.5 | 1.2 | 1.0 | 1.64 | 2.1 | 102.1 |

Die den Berechnungen zu Grunde liegenden Oktavspektren zu den jeweiligen Summenschallpegeln können den Ausdrucken „Übersicht der Eingabedaten zur Immissionsprognose“ im Anhang 1 entnommen werden. Die Angaben zum Schallleistungspegel, bzw. dem Oktavband, aus den Herstellerangaben [14], können dem Anhang 6 des Gutachtens entnommen werden.

Anmerkung:

In den Berechnungen wird von einem worst-case Fall ausgegangen, den es in Wirklichkeit nicht geben kann. Die Immissionen für jeden Immissionspunkt werden so berechnet, dass der Immissionspunkt von jeder Anlage aus gesehen in Mitwindrichtung steht. Dies würde bedeuten, dass der Wind gleichzeitig aus mehreren Richtungen kommen müsste.

Eine Schallpegelminderung durch C_{met} -die meteorologische Korrektur- findet ebenso keine Berücksichtigung wie die abschirmende Wirkung von Gebäuden und/oder die Dämpfung durch Bewuchs.

Die genannten Punkte können als zusätzliche Sicherheit bei der Beurteilung dienen.

11 Zusammenfassung

Für den Standort Krinitz-Steesow wurde eine Immissionsprognose entsprechend den LAI-Hinweisen zum Schallimmissionsschutz bei Windkraftanlagen, Stand 30.06.2016 [11], und der Dokumentation zur Schallausbreitung – Interimsverfahren zur Prognose der Geräuschimmissionen von Windkraftanlagen, Fassung 2015-05.1“ [10], an den benachbarten Immissionsorten durchgeführt. Die Festlegung der Rahmenbedingungen erfolgte durch eine Standortbesichtigung. Es wurde die Vor-, Zusatz- und Gesamtbelastung berücksichtigt. Die Ergebnisse der Immissionsprognose für die Gesamtbelastung, unter den genannten Voraussetzungen, sind der Tabelle 11.1 zu entnehmen.

Für die Beurteilungspegel sind nach den Rundungsregeln der DIN 1333 entsprechend ganzzahlige Werte anzugeben.

Tabelle 11.1: Ergebnisse der Immissionsprognose

| Nr. | Bezeichnung | IRW [dB(A)] | Immissionspegel L_r [dB(A)] | Beurteilungspegel L_r [dB(A)] | Reserve zum IRW [dB(A)] |
|------|--|----------------|-------------------------------------|---------------------------------------|-------------------------------|
| IO1 | Lenzener Str. 10, 19294 Gorlosen | 45 | 37.5 | 38 | 7 |
| IO2 | Lenzener Str. 12, 19294 Gorlosen | 45 | 39.3 | 39 | 6 |
| IO3 | Neuhof 3, 19294 Gorlosen | 45 | 37.2 | 37 | 8 |
| IO4 | Lindenstr. 2, 19300 Milow | 45 | 42.4 | 42 | 3 |
| IO5 | Deibower Dorfstr. 35, 19300 Deibow | 45 | 42.5 | 43 | 2 |
| IO6 | Deibower Dorfstr. 15, 19300 Deibow | 45 | 40.7 | 41 | 4 |
| IO7 | Deibower Dorfstr. 42, 19300 Hof Deibow | 45 | 40.3 | 40 | 5 |
| IO8 | Am Brink 1, 19300 Steesow (unbebaut) | 45 | 39.8 | 40 | 5 |
| IO9 | Am Brink 2, 19300 Steesow | 45 | 40.1 | 40 | 5 |
| IO10 | Am Brink 8b, 19300 Steesow | 45 | 39.6 | 40 | 5 |
| IO11 | Poststr. 8, 19300 Steesow | 45 | 38.9 | 39 | 6 |
| IO12 | Bergstr. 11, 19300 Bochin | 45 | 39.4 | 39 | 6 |
| IO13 | Waldstr. 7, 19300 Grabow | 45 | 47.0 | 47 | -2 |
| IO14 | Waldstr. 6, 19300 Grabow | 45 | 46.7 | 47 | -2 |
| IO15 | Kastanienallee 1, 19294 Görnitz | 45 | 37.5 | 38 | 7 |
| IO16 | Lenzener Str. 4, 19294 Krinitz | 45 | 41.9 | 42 | 3 |
| IO17 | Lenzener Str. 1a, 19294 Krinitz | 45 | 41.8 | 42 | 3 |

An allen Immissionsorten, mit Ausnahme von IO13 und IO14, wird unter den o.g. Voraussetzungen der Immissionsrichtwert unterschritten.

An den Immissionsorten IO13 und IO14 wird der Immissionsrichtwert um mehr als 1 dB(A) überschritten. Diese Überschreitung wird jedoch durch die Vorbelastung verursacht (siehe Berechnungsergebnisse in Kapitel 9.2). Die Immissionsorte befinden sich außerhalb des Einwirkungsbereiches der gesamten Zusatzbelastung (10 dB(A) unter Immissionsrichtwert). Zudem ist jeder Teilpegel der einzelnen neu geplanten WEA mehr als 15 dB(A) unterhalb des IRW (siehe Anhang 4A) womit die Kriterien der Sonderfallprüfung ebenfalls erfüllt sind.

Unter den in 10, Qualität der Prognose, dargestellten Bedingungen ist gemäß [6, 11] von einer ausreichenden Prognosesicherheit auszugehen und somit bestehen aus der Sicht des Schallimmissionsschutzes keine Bedenken gegen die Errichtung und den Betrieb der hier geplanten Windenergieanlagen.

Zusammenfassend sind von den geplanten Windenergieanlagen keine schädlichen Umwelteinwirkungen durch Geräusche zu erwarten.

12 Abkürzungs- und Symbolverzeichnis

| Abkürzung / Symbol | Bedeutung |
|-------------------------|--|
| A | Dämpfung |
| AB | Außenbereich |
| A_{atm} | Dämpfung durch die Luftabsorption |
| A_{bar} | Dämpfung aufgrund der Abschirmung (Schallschutz) |
| Abb. | Abbildung |
| A_{div} | Dämpfung aufgrund der geometrischen Ausbreitung |
| A_{gr} | Bodendämpfung |
| A_{misc} | Dämpfung aufgrund verschiedener Effekte (Bewuchs, Bebauung, Industrie) |
| Bez. | Bezeichnung |
| BHKW | Blockheizkraftwerk |
| dB(A) | A-bewerteter Schalldruckpegel |
| C_{met} | Meteorologische Korrektur |
| D_c | Richtwirkungskorrektur |
| d_p | Abstand zwischen Schallquelle und Empfänger |
| GK | Gauß – Krüger |
| h_m | mittlere Höhe (in Meter) des Schallausbreitungsweges über dem Boden |
| h_r | Höhe des Immissionspunktes über Grund |
| h_s | Höhe der Quelle über dem Grund (Nabenhöhe) |
| i | Index für alle Geräuschquellen von 1-n |
| IRW | Lärm- Immissionsrichtwerte |
| kTN | Tonhaltigkeit |
| K_{Ti} | Zuschlag für Tonhaltigkeit einer Emissionsquelle i |
| K_{ji} | Zuschlag für Impulshaltigkeit einer Emissionsquelle i |
| L_{AT} | Beurteilungspegel am Immissionspunkt |
| $L_{r,WEA,IP}$ | prognostizierter Teilimmissionspegel jeder beantragten WEA an jedem Immissionspunkt exklusive jeglicher Unsicherheiten |
| $L_{w,Okt}$ | Oktavschalleistungspegel der WEA ohne jegliche Unsicherheiten |
| L_{WA} | Schalleistungspegel der Punktschallquelle A-bewertet |
| M | Gemischten Bauflächen |
| MD | Dorfgebiet |
| MI | Mischgebiet |
| NHN | Normalhöhennull |
| Nr. | Nummer |
| OVB | Oberer Vertrauensbereich |
| s | Standardabweichung |
| UTM | Universal Transverse Mercator |
| WEA | Windenergieanlage |
| WKA | Windkraftanlage |
| α_{500} | Absorptionskoeffizient der Luft (= 1.9 dB/km) |
| σ_{ges} | Gesamtstandardabweichung |
| σ_R | Standardabweichung der Messergebnisse |
| σ_P | Produktionsstandardabweichung, Produktstreuung |
| σ_{Progn} | Standardabweichung des Prognoseverfahrens |

| | |
|-----------------|--|
| v ₁₀ | Windgeschwindigkeit in 10 m über Grund |
|-----------------|--|

Eingangsgrößen für Schallimmissionsprognosen Vestas V162-5.6/6.0/6.2 MW

Die für den Windenergieanlagentyp und Betriebsmodus spezifischen Eingangsgrößen für Schallimmissionsprognosen bestehen aus

- Mittlerer Schalleistungspegel \overline{L}_W (P50) und
- dazugehörigen Oktavspektrum
- Unsicherheit des Schalleistungspegels σ_{WTG} mit einem Vertrauensniveau von 90% (P90): $1,28 \times \sigma_{WTG}$

und bilden unter anderem die Grundlage der Schallimmissionsprognosen für die Windparkplanung.

Als Datengrundlage stehen Schalleistungspegel und Oktavspektrum in Abhängigkeit der Verfügbarkeit aus einer der folgenden Quellen zu Verfügung:

- Herstellerangabe (siehe Absatz A)
- Einfachvermessung (siehe Absatz B)
- Mehrfachvermessung (Ergebniszusammenfassung aus mind. 3 Einzelmessungen (siehe Absatz C))

Der minimale Abstand zwischen der Windenergieanlage und dem Immissionspunkt muss (3) x Gesamthöhe der Windenergieanlage, jedoch Minimum 500m betragen.

A. Herstellerangabe

Liegt kein Schall-Emissionsmessbericht für die geplante Windenergieanlage (WEA) vor muss die Schallimmissionsprognose auf den hier dargestellten Herstellerangaben $L_{e,max}$ (P90) basieren.

In den VESTAS Spezifikationen (Allgemeine Spezifikation bzw. Leistungsspezifikation) ist der mittlere zu erwartende Schalleistungspegel \overline{L}_W (P50) dargestellt.

Gemäß dem vom LAI eingeführten Dokument „Hinweise zum Schallimmissionsschutz bei Windkraftanlagen (WKA)“, überarbeiteter Entwurf vom 17.03.2016 mit Änderungen PhysE vom 23.06.2016 Stand 30.06.2016 (LAI Hinweise) enthält die hier dargestellte Herstellerangaben (P90) $L_{e,max}$ (P90) ebenfalls zu berücksichtigende die Unsicherheit des Schalleistungspegels.

Vestas garantiert den maximal zulässigen Emissionspegel der WEA $L_{e,max}$ (P90) gemäß nachfolgender Formel:

$$L_{e,max} = \overline{L}_W + 1,28 \cdot \sigma_{WTG}$$

| Blattkonfiguration | STE & RVG (Standard) | | | | | | | | |
